

# Concrete Protective Liners for Chilean Copper Mine

---

In the first half of 2024, a new concrete protection project was realized in Antofagasta, Chile. Reinforced concrete in a large copper mine was effectively protected against corrosion with robust and reliable AGRU concrete protective liners.

In order to keep the concrete in critical areas as good as new in the long term, 1,000 m<sup>2</sup> of Ultra Grip concrete protection liners made of 5 mm HDPE with a non-slip surface and 300 kg of HDPE welding rod were used. The installation was carried out by an experienced local company.

Ultra Grip concrete protective liners made of HDPE provide complete waterproofing of concrete and are highly resistant to abrasion, chemicals, and other aggressive influences. The anti-slip surface also ensures safety in work areas and minimizes the risk of accidents.

For years, AGRU-Sure Grip & Ultra Grip concrete protective liners have proven their effectiveness in demanding applications such as mining. They significantly reduce maintenance requirements and offer a reliable, long-term solution for the mine's infrastructure.
